EtherCAT Module and Object Dictionary Supplement

HA-MFV EtherCAT Communication

Figure 1: HA-MFV EtherCAT

EthercCAT is a high performance Ethernet based fieldbus network protocol that takes advantage of the efficient way messages between the master and slave devices propagate through the network. Messages or instructions from the master are —passed throughII each slave device (node), and corresponding data from the slave device is added to the output message that is going to the next node in the network. This process continues throughout the network and, when the message arrives back at the master, every slave has received new input data from the master and returned new output data to the master.

EtherCAT requires an ESI file that provides the master with an appropriate configuration file specific to a HA-MFV Model.

1.1.1 HA-MFV Ethercat Features

Two Ethernet ports marked <IN> and <OUT> are used to propagate messages from the master (IN), adding any data to the string and then allowing message to pass to the next slave or node (OUT).

There are three LEDs for Power (PWR), Network communication (RUN), and network issues (ERR).

LED status indicators function as follows:

• When power has been established, the PWR LED will turn solid green.

- The RUN LED will remain dark until a network connection between the master and slave has been established and the device has been put in an operational mode by the master. At this time, the slave device will respond to messages from the master and the LED is solid green.
- The ERR LED stays dark as long as there are no issues between the master and the slave. If an issue is detected, the LED will flash red.

ECAT ID consists of three rotary switches that provide an option of manually setting the node address (function is normally automatic from the master). A maximum of 4095 distinct addresses can be set by these rotary switches and it is important to note that these switches are in HEX (max setting FFF = 4095 decimal).

• Ethernet port on the side of the electronics enclosure that provides access to the embedded Web Browser (see HA-MFV Manual).

1.1.2 Power Connections

Figure 2: Power Connection

1.2 Profinet Cables

	TABLE I	
PART NO.	SUPPLIER PT. NO.	CABLE LENGTH (MM)
1056693-001	20086-5564	2000
1056693-002	20086-5566	5000

This cable is for power only. Pin 1 (Brown) supplies +24V and Pin 3 (Blue) is power common. Cable is manufactured for MKS by Molex.

		LUXU		IVI		ĸw					Command	Redu:
			OFBYIE									Bit 0 = 1: slave saves the non-volatile
												parameters when writing 0xFBF2:01 with
												Bit 1 = 1: slave saves the non-volatile
												parameters automatically when they are
												written
												Bit 2-31: reserved, shall be 0
												write:
												All writable, non-volatile values will be stored
												in non-volatile memory when the following is
												sent:
												Byte 0: 0x73
												Byte 1: 0x61
												Byte 2: 0x76
												Byte 3: 0x65
												If other values are written the Abort Code
												"0x06040043 General parameter
												incompatibility reason" shall be returned.
		0x02	USINT	м		RO					Status	Supported values:
												0: last command completed, no error, no
												response
												1: Reserved
												2: last command completed, error, no
												response
												3-99: Reserved,
												100-200: indicates how much of the
												command has been executed (in %, 100 = 0%,
												200 = 100%)
												201-254: Reserved,
												255: command is executing (if the percentage
												display is not supported)

												Byte 2-n: Checksum return value. Size varies
												depending on checksum type used. The
												maximum length shall be 64 bytes.
0xFBF4	RECORD		COMMAND_	М		RO					Load Parameters Command	Execution of this command will load all
			PAR									parameters from non-volatile memory. If a
												device automatically saves all non-volatile
												parameters at the time they are written, this
												command will not take any action. In the
												event that this command may interfere with
												the safe or expected functional operation of
												a device, it may be optionally restricted to
												functioning only in certain functional
												conditions while in OPERATIONAL state. If the
												command cannot be performed due to this
												operating condition, the Abort Code "0x08 00
												00 21" shall be returned. In this case,
												documentation shall be supplied detailing the
												proper condition to execute this command.
												All devices shall be able to execute this
												command in PREOP without restriction.
